# Disagreement as a Candidate Error Correlate

| Bivariate Association | |
|---|---|
| Pearson $r$ | 0.3125 |
| $p$-value (two-sided) | 0.0271 |
| Spearman $\rho$ | 0.2302 |
| $p$-value (two-sided) | 0.1078 |

| Nested OLS (In-Sample) | |
|---|---|
| Model (base) | $E \sim P_{ens} + Length$ |
| Model (extended) | $E \sim P_{ens} + Length + \Delta$ |
| $F(1, 46)$ | 5.676 |
| $p$-value | 0.0214 |
| $R^2_{base}$ | 0.0543 |
| $R^2_{ext}$ | 0.1582 |
| $\Delta R^2_{in}$ | +0.1039 |
| $\hat{\beta}_\Delta$ (SE) | 0.6270 (0.2631) |

| Five-Fold OOF Analysis | |
|---|---|
| $\Delta R^2_{OOF}$ | +0.0805 |

***Note:*** *$\Delta = |P_{qwen} - P_{smollm}|$ and $E = |P_{ens} - h_{primary}|$. Pearson significance is nominal and unadjusted; Spearman is not statistically significant. OOF $\Delta R^2$ is descriptive only. Inter-judge disagreement is a candidate error correlate, not a validated uncertainty measure.*
